

Bineetbhusan Das

Senior Software Engineer | Java Backend | Spring Boot · Microservices · Distributed Systems · AWS

+91 7540844677 • bineetbhusandas@gmail.com • [LinkedIn](#) • [GitHub](#) • [Portfolio](#)

Professional Summary

Senior Java Backend Engineer with **nearly 5 years** building distributed, event-driven systems on Spring Boot and AWS. Designed the pipelines behind **300K+ shipments and millions of events a day**, plus the search, caching and scheduling frameworks adopted across the platform. Led a 9-person cross-functional team through a greenfield production delivery as **Lead Developer**; currently **Module Lead**, owning backend architecture across multiple modules. **High Achiever for 3 consecutive cycles**.

Technical Skills

- **Languages & Core:** Java (8/11/17/21), SQL, OOP, SOLID, Design Patterns (Strategy, Template Method, Factory), Data Structures & Algorithms
- **Frameworks:** Spring Boot 3.5, Spring MVC / Data JPA / Security / AOP, Hibernate, MapStruct, Lombok, REST APIs
- **Cloud & Messaging:** AWS Lambda, API Gateway, SQS (FIFO), SNS, S3, RDS, Secrets Manager, IAM; Event-Driven Architecture, Microservices, Distributed Systems, **CQRS**, Transactional Outbox Pattern, Idempotency, System Design (HLD/LLD), CI/CD (CodeBuild / CodePipeline / CodeCommit)
- **Concurrency & Performance:** Multithreading, **Java 21 Virtual Threads**, ExecutorService / CompletableFuture, async processing, Caffeine caching, HikariCP & connection-pool tuning, read/write datasource routing
- **Data & Security:** MySQL / SQL Server, Redis, JPA / Hibernate, Flyway, SQL Query Optimization, Indexing; Auth0, JWT, OAuth 2.0, RBAC, data-level authorization
- **Quality & Tooling:** JUnit, Mockito, Testcontainers, SonarQube, JaCoCo, Swagger / OpenAPI, Maven, Git, JIRA, Azure Boards, Docker (working knowledge), Agile / Scrum, Linux
- **Working Knowledge:** Angular, TypeScript (frontend integration; primary focus is backend)
- **AI-Augmented Development:** **Claude Code and GitHub Copilot** across design, implementation, test generation and refactoring, with changes verified through tests, static analysis and code review before merge

Professional Experience

Senior Software Engineer (Java Backend), Cozentus Technologies Pvt. Ltd. | Bhubaneswar, India | Jan 2022 – Present

Client: PSA BDP (Global Logistics & Supply Chain). Career progression: Intern → Software Engineer → Senior Software Engineer (Java Backend).

Integrated Track & Trace (ITT), Multi-Modal Visibility Platform · *Module Lead*

Greenfield next-gen multi-modal (ocean / air / rail / road) tracking platform, Java 21, Spring Boot 3.5, AWS, MySQL.

- Engineered the event-driven pipeline (AWS Lambda, SQS FIFO, SNS) that carries **millions of tracking events a day**, using idempotency and the **Transactional Outbox Pattern** so publication survives retries and partial failures.
- Audited **211K+ rows** of legacy master data by business key and removed **24K+ duplicate or invalid records** before go-live. Added unique database constraints so it could not happen again.
- Built the shared backend layer every service is built on: read/write database routing, caching, security, exception handling, and the team's API standards.
- Cut repeated database lookups by matching caching to deployment topology: Caffeine for the single-instance scheduler and Redis built for scale-out deployments, with group-based cache invalidation on data updates plus TTL and LRU eviction.
- Wrote a config-driven search layer (dynamic JPQL, ~20 filter operators, paging, sorting) now used by **22+ entities**. Adding search to a new entity is a config class instead of hand-written queries.
- Built the auth layer: Auth0 JWT validation, **3-level RBAC**, and a query-level filter that scopes every read to the caller's authorized companies, so a valid token alone cannot cross tenants.
- Replaced duplicated scheduling code across the platform with one Java 21 virtual-thread scheduler framework, now running **9 production modules** with runtime enable/disable.

- Built a User-Company access-control system for **10K+ companies** with bulk assignment and lazy loading. Another team later adopted it for their own module.

Charge Automation Platform (Demurrage & Detention) · *Lead Developer*

Greenfield carrier charge-calculation platform, Java 17, Spring Boot, AWS SQS, Auth0, MySQL.

- Led end-to-end delivery of a greenfield platform to production in **~4 months** with a **9-person cross-functional team** (frontend, backend, BA, QA), owning backend architecture and the database schema.
- Designed the multi-currency Cost Calculator and Contract Matching engines that replaced a manual, error-prone process, computing carrier charges for **300K+ shipments/day** across **~100K contracts**.
- Built the threshold alerting engine that warns operations before charges accrue, the platform's core cost-avoidance path.
- Introduced SonarQube and SonarLint to the team and cleared critical vulnerabilities before release; the platform's **first production go-live** shipped with **zero critical defects** and written client appreciation.

Smart Navigator, Carrier Integration & Tracking Platform · *Backend Engineer*

Enterprise ocean-tracking platform integrating 50+ carriers, Java 8–17, Spring Boot 3, AWS Lambda, MySQL.

- Scaled carrier polling across **50+ integrations**: re-architected sequential to controlled parallel execution with per-carrier concurrency and rate-limit controls, sized from measured carrier capacity rather than a global thread count, for an estimated **10-15x** throughput gain.
- Owned **50+ production REST endpoints** and the Swagger/OpenAPI contracts the Angular team built against.
- Built 3 carrier integrations on the shared adapter framework, then independently built an RPA-based tracking service that closed the tracking gap for the **~16 carriers with no public API** at all.
- Replaced a manual daily Excel-and-email handoff with a serverless Lambda pushing tracking links to a customer system: **~10-15K shipments/day**, data latency cut from once-daily to **under 15 minutes**.
- Configured **JaCoCo** across all backend projects, authored the team's **JUnit guideline**, and mentored **~6 engineers** onto the adapter framework.
- Owned end-to-end release management for a year: cherry-picked each release package, sequenced the DB migration scripts collected from every developer, ran the client approval gates, and owned rollback. **Zero release-related production issues**.

Key Achievements

- **High Achiever, 3 consecutive cycles** (FY 2023–24 / 24–25 / 25–26) and **4 promotions, most recently in Jun 2026**.
- **CEO discretionary bonus** for delivering beyond role expectations; **On-Spot Award (2026)** for ownership and immediate business impact.
- Led organization-wide adoption of **AI-augmented development** through org-level knowledge-transfer sessions.

Education

- **MCA, Silicon Institute of Technology, Bhubaneswar (BPUT), 2022, CGPA 9.13**
- **BSc, F.M. University, 2020, CGPA 8.14**
